

Climate Change Economics

Bevin Ashenmiller, Ph.D.
Occidental College

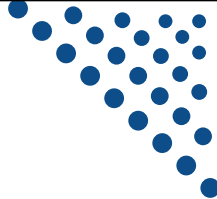

Grass Valley Rotary Club

April 12, 2021

1

National Economic Education Delegation

- **Vision**

 - One day, the public discussion of policy issues will be grounded in an accurate perception of the underlying economic principles and data.
- **Mission**

 - NEED unites the skills and knowledge of a vast network of professional economists to promote understanding of the economics of policy issues in the United States.
- **NEED Presentations**

 - Are **nonpartisan** and intended to reflect the consensus of the economics profession.

2

2

Who Are We?

• Honorary Board: 48 members

- 2 Fed Chairs: Janet Yellen, Ben Bernanke
- 6 Chairs Council of Economic Advisers
 - o Furman (D), Rosen (R), Bernanke (R), Yellen (D), Tyson (D), Goolsbee (D)
- 3 Nobel Prize Winners
 - o Akerlof, Smith, Maskin

• Delegates: 500+ members

- At all levels of academia and some in government service
- All have a Ph.D. in economics
- Crowdsource slide decks
- Give presentations

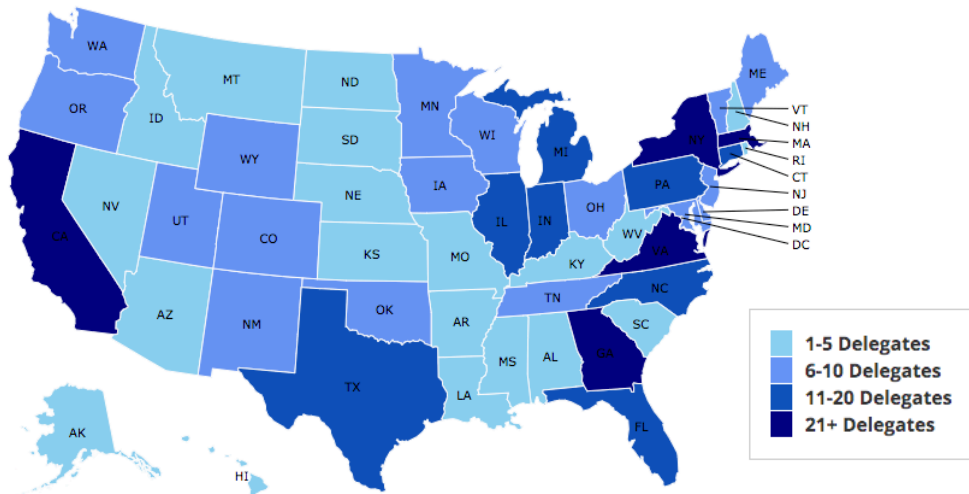

• Global Partners: 45 Ph.D. Economists

- Aid in slide deck development

3

Where Are We?

4

Credits and Disclaimer

- **This slide deck was authored by:**
 - Shana Mcdermott, Trinity University
 - Sarah Jacobson, Williams College
 - Sharon Shewmake, Western Washington University
- **This slide deck was reviewed by:**
 - Jason Shogren, University of Wyoming
 - Walter Thurman, North Carolina State University
- **Disclaimer**
 - NEED presentations are designed to be nonpartisan.
 - It is, however, inevitable that the presenter will be asked for and will provide their own views.
 - Such views are those of the presenter and not necessarily those of the National Economic Education Delegation (NEED).

5

Outline

- **Climate change science**
- **Impacts of climate change**
- **Economics of responding to climate change**
- **Addressing the sources of our emissions**
- **Climate change policy**
- **Policy in action**

6

What is Economics?

Economics breaks down into two basic fields:
Microeconomics and Macroeconomics.

Microeconomists...“who are wrong about specific things.”

and Macroeconomists...“who are wrong about things in general”.

Yoram Bauman, PhD

Mankiw's 10 Principles of Economics Translated

But First: What Is Economics?

- **Economics is about making choices under scarcity.**
 - Individuals and firms
- **How do goods and services get allocated among entities in society?**
- **How is value created by trade?**
- **How do “market failures” restrict that value creation?**

The First Theorem of Welfare Economics

...is that private markets are perfectly efficient on their own, with no interference from government, provided certain conditions are met.

What is the profit of buyers?

What is the profit of sellers?

Economic Efficiency: When the sum of the profits of buyers and the profit of sellers is maximized.

***You can't make anyone better off without making someone worse off.**

NATIONAL ECONOMIC
EDUCATION DELEGATION

9

What are “certain conditions”?

No public goods

No information problems

No externalities

No transaction costs

No taxes

No common property

No monopoly buyers or sellers

No increasing returns to scale

No other ‘distortions’ between the costs paid by buyers and the benefits received by sellers.

Environmental Economists are microeconomists who believe that markets sometimes fail.

NATIONAL ECONOMIC
EDUCATION DELEGATION

10

Characteristics of Goods

Excludable: Goods that you can exclude people from using.

Rival: One person's use of the good diminishes other's ability to use the good.

Public Goods (Not Rival or Excludable): Benefits additional users at no cost to society.

Common Resources (Rival, but not Excludable): Common property, or open access resources, where anyone can extract or harvest the resource freely and **no one** recognizes the full cost of using the resource.

11

Characteristics of Goods & Environmental Economics

Externalities: some costs or benefits of producing, consuming, or disposing of a good or service are external to the market.

Missing Markets Problem: some goods (or inputs) into production are not sold on a market. Firms and individuals then sometimes value the good at what they pay for it, \$0, instead of what it is worth.

12

Economics Informs Almost Everything

- Prices
- Incentives
- Externalities
- Cost-Benefit Analysis
- Growth
- Inflation
- Interest Rates
- Climate Change
- International Trade
- Immigration
- Housing
- Education
- Health Care
- Gun Control

13

How Can Economists Contribute to Thinking about Climate Change?

- **By assessing behavioral reactions to climate change.**
- **By measuring the damage and estimating the economic costs of fighting climate change.**
- **By designing smart policies that minimize costs.**
 - Balance economic growth with GHG emission mitigation.

14

17

Uncertainty

 NATIONAL ECONOMIC EDUCATION DELEGATION

18

19

20

How Much Pollution Does Society Want?

Analogy: How Many Oranges Does Society Want?

- People grow and sell oranges for a price that at least covers costs (*supply*).
- People will not pay more for them than what they consider to be their value (*demand*).
- Prices let *supply* and *demand* balance out. The price settles where:

of oranges people want to sell = # of oranges people want to buy

- This is the “right” number of oranges for society.
- Prices reflect scarcity and the social value of the resource.

NATIONAL ECONOMIC
EDUCATION DELEGATION

21

Electricity Is Different From Oranges

- **Many sources of electricity generate pollution.**
- **Pollution is an EXTERNALITY:**
 - a side effect (cost or benefit) that affects someone else when something is bought or sold.
 - This is a *market failure*.
- **The price of electricity does not reflect all of the costs.**
 - Electricity is too cheap.
 - There is too much pollution.

NATIONAL ECONOMIC
EDUCATION DELEGATION

22

Social Cost of Carbon

- **Cost above price paid.**
- **The expected cost of damages from each unit of greenhouse gas emissions.**
- **Current EPA estimate: ~\$40 per metric ton of CO₂.**
 - About \$123/car per year.
 - \$26 Billion for all vehicles in the US.
- **Social cost of carbon will increase over time.**

NATIONAL ECONOMIC
EDUCATION DELEGATION

23

Examples of Externalities

- | | |
|---|--|
| <ul style="list-style-type: none"> • Negative Externalities: <ul style="list-style-type: none"> - Heating your house - Smoking - Getting a dog - Pig farming | <ul style="list-style-type: none"> • Positive Externalities <ul style="list-style-type: none"> - Education - Growing apples - Getting a vaccination - Basic scientific research |
|---|--|

NATIONAL ECONOMIC
EDUCATION DELEGATION

24

24

Addressing a Negative Externality

The social cost of $\$.02/\text{kwh}$ has been INTERNALIZED.

NATIONAL ECONOMIC EDUCATION DELEGATION

25

25

Impacts of Climate Change

NATIONAL ECONOMIC EDUCATION DELEGATION

26

Global Warming Indicators

27

How These Impacts Affect Humans

- Agriculture
- Fisheries
- Coastal damages
- Direct health effects, including sickness and death (temperature & drought; also pollution)
- Indirect health effects (vector-borne disease)
- Reduced fresh water availability
- Wildfires
- Shifting zones for important ecosystems, and desertification
- Reduced worker productivity
- Increased violence
- Some of these may cause human migration and/or conflict

28

Adaptation Reduces Damages

- Human *adaptations* are costly actions that can reduce damages from climate change.
- The **net cost to society** is the **cost of adaptation** plus the **cost of the remaining damages**.
- People will take some actions on their own, up to the point where they find it worthwhile.
- Some responses require government involvement: large-scale actions or actions with shared benefits.
- Adaptation is already underway.

NATIONAL ECONOMIC
EDUCATION DELEGATION

29

Individual-Level Adaptation Examples

- **Do you behave differently on a hot day?**
 - Staying inside more.
 - Turn on the air conditioning.
 - Plant at different times.
 - Plant new crops.
 - Think about moving.

NATIONAL ECONOMIC
EDUCATION DELEGATION

30

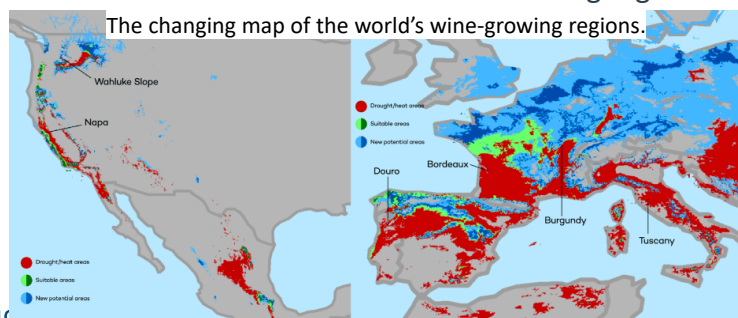

Public Adaptation

- **Governments can help:**
 - When collective action is less costly than everyone acting alone.
 - When individual action is not possible or likely.
 - When some people can't protect themselves.
- **Sea walls**
- **Ecosystems that provide protection**
- **Supporting low-income and vulnerable populations**
- **Moving residents of a town**

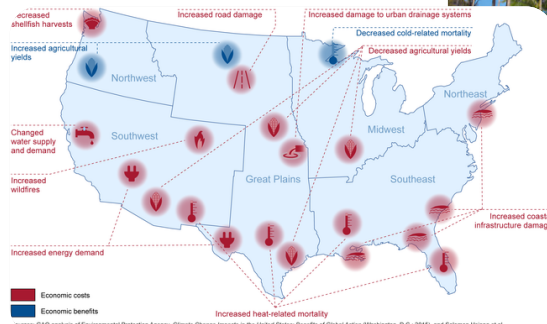

Market Based Adaptation

- **Prices and costs influence behavior.**
 - Where to live.
 - Where/when/what to plant.
- **Avoid barriers to market adjustment.**
 - Trade barriers, immigration restrictions, federal flood insurance, agricultural subsidies, and zoning regulations.

Most Vulnerable People and Places

- Tropical areas
- Low-lying coastal areas
- Low-income people

NATIONAL ECONOMIC EDUCATION DELEGATION

33

Projected Effects Vary Across the U.S. but Are Estimated at 1.2% of GDP per 1C Increase

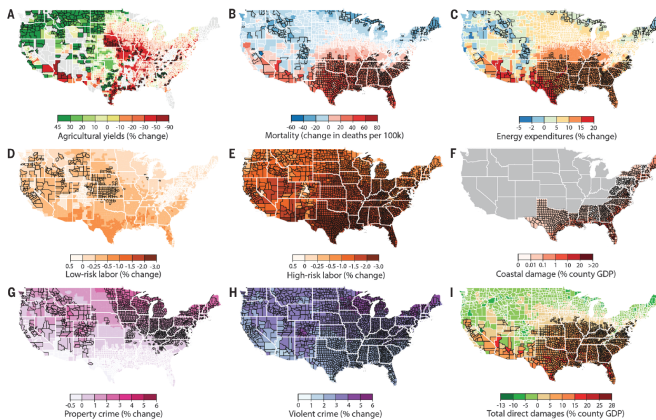

Fig. 2. Spatial distributions of projected damages. County-level median values for average 2080 to 2099 RCP8.5 impacts. Impacts are changes relative to counterfactual “no additional climate change” trajectories. Color indicates magnitude of impact in median projection; outline color indicates level of agreement across projections (thin white outline, inner 66% of projections disagree in sign; no outline, ≥83% of projections agree in sign; black outline, ≥95% agree in sign; thick white outline, state borders; maps without outlines shown in fig. S2). Negative damages indicate economic gains. (A) Percent change in yields, area-weighted average for maize, wheat, soybeans, and cotton. (B) Change in all-cause mortality rates, across all age groups. (C) Change in electricity demand. (D) Change in labor supply of full-time-equivalent workers for low-risk jobs where workers are minimally exposed to outdoor temperature. (E) Same as (D), except for high-risk jobs where workers are heavily exposed to outdoor temperatures. (F) Change in damages from coastal storms. (G) Change in property-crime rates. (H) Change in violent-crime rates. (I) Median total direct economic damage across all sectors [(A) to (H)].

NATIONAL ECONOMIC EDUCATION DELEGATION

34

Use Evidence to Drive Change

- 1) What is the Market Failure associated with School Greening? Positive Externalities and Public Goods
 - 2) Goods with positive externalities are underprovided by the market.
 - 3) School Greening Benefits Include
 - Improving children’s social, physical and educational well-being.
 - Actively managing storm water.
- As components of urban ecological infrastructure: mitigating urban heat island effects and climate change, while increasing renewable energy production, wildlife habitat provision, and related ecosystem services.

Canopy Cover

- Yellow circle: Sycamore
- Green circle: Evergreen
- Orange circle: Palm Tree

Surface Types

- Blue hatched: Building roof line
- Grey hatched: Accessible paved play area
- Green hatched: Accessible unpaved play area
- Light green: Inaccessible landscape
- Dark green hatched: Inaccessible open space/HV dip/drinks
- White hatched: Parking lot
- White with dots: Walkways and other pavement
- Green with dots: School garden

38

Economics of Responding to Climate Change

NATIONAL ECONOMIC
EDUCATION DELEGATION

39

International Climate Policy Goals

- **Intergovernmental Panel on Climate Change (IPCC)**
 - Global effort to fight climate change
 - Reports on consensus of climate science, including economics
- **IPCC report in 2007:**
 - Recommended goal: < 2 degrees C (3.6 degrees F)
 - Industrialized countries should reduce GHG emissions between 25% and 40% below 1990 levels by 2020.
- **2016 Paris Agreement:**
 - Basic goal of 2 degrees C: requires 40-70% GHG reduction 2010 → 2050
 - Reach goal of 1.5 degrees C: requires 70-95% GHG reduction 2010 → 2050
- **IPCC report in 2018:**
 - Temperature has already increased by 1.0 degrees C - Recommended: < 1.5 C

NATIONAL ECONOMIC
EDUCATION DELEGATION

40

Recent Progress on Climate Goals

- **IPCC’s Fifth Assessment Report (2014)**

- Goals from previous report (2007) were met!
- ... but mainly because of the Great Recession...
- ... which is not the preferred method of reducing emissions.

How Economists Decide How Much to Fight Climate Change

- **Cost Benefit Analysis**
- **Weigh:**

Cost-Benefit Analysis of Fighting Climate Change

- Most economic models suggest the costs of keeping warming below 2°C are relatively small.
 - Costs amount to **1-4% of GDP by 2030.**
- Costs of acting to keep warming below 2°C are almost certainly less than future economic damages they would avoid.
 - Damages estimated to be between: **7 - 20% of worldwide GDP.**
- **Caveats:**
 - Putting a monetary value on priceless things
 - Inequality
 - Uncertainty and risk

NATIONAL ECONOMIC
EDUCATION DELEGATION

43

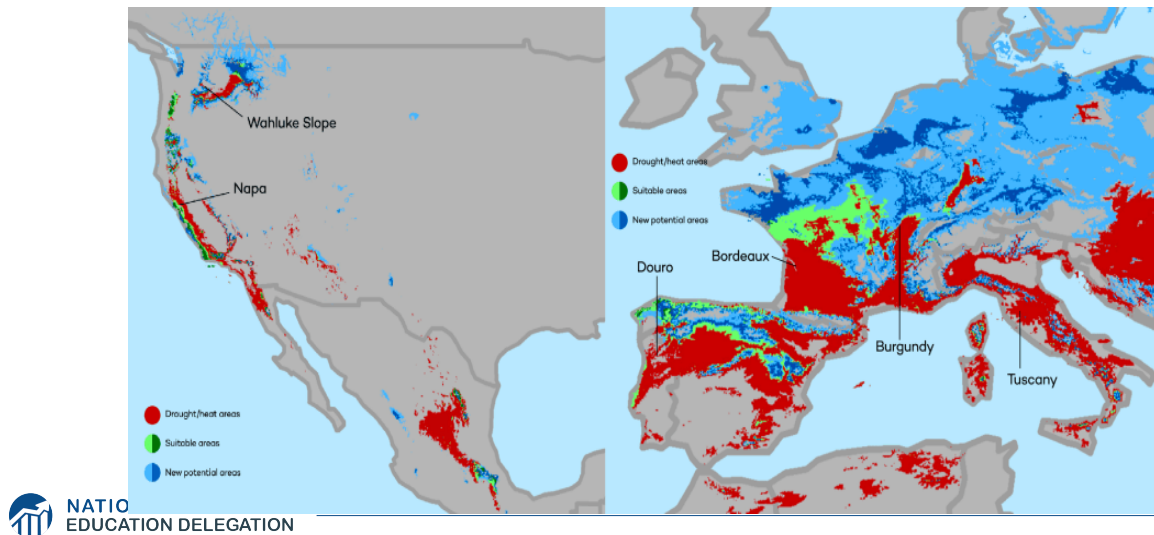

“It is better to be roughly right than precisely wrong.”

- John Maynard Keynes

44

This is What Precisely Wrong Looks Like

The changing map of the world's wine-growing regions.

45

45

Economic Growth and Climate Change Action Are Compatible

- Abating greenhouse gas emissions is costly...
... but climate change damages are even more costly.
- Economic growth comes with consequences that we have to deal with, including climate consequences.
- Economies with environmental regulations can still be dynamic.
- Goal: design policies that reach climate goals at the least possible cost.

46

Addressing the Sources of Our Emissions

47

Total U.S. Greenhouse Gas Emissions by Economic Sector in 2018

U.S. Environmental Protection Agency (2020). Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2018

48

Fossil Fuels Dominate U.S. Energy Production

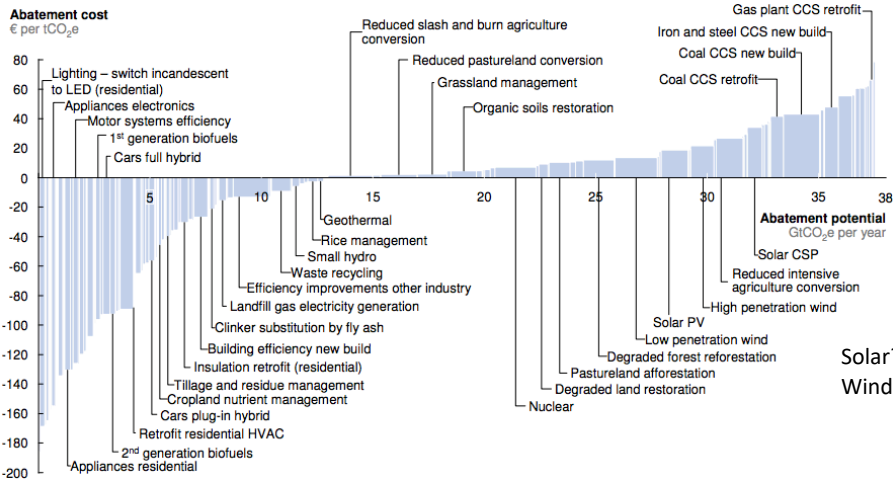

Energy consumption by sector (Reference case)
quadrillion British thermal units

Energy consumption by fuel (Reference case)
quadrillion British thermal units

Global GHG Abatement Cost Curve

Note: The curve presents an estimate of the maximum potential of all technical GHG abatement measures below €80 per tCO₂e if each lever was pursued aggressively. It is not a forecast of what role different abatement measures and technologies will play.
Source: Global GHG Abatement Cost Curve v2.1

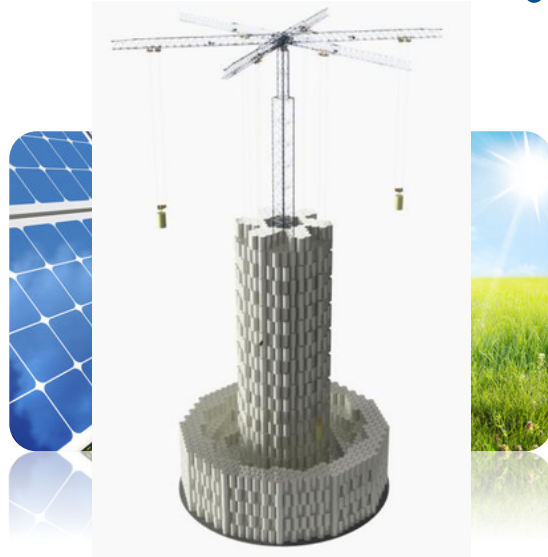

51

52

Challenges with Renewable Energy

- **It's intermittent - only produced if there is sun or wind.**
- **Energy is needed all day and night, with peak times.**
- **Limited w/o storage.**
 - Creative storage options are under development.

NATIONAL ECONOMIC
EDUCATION DELEGATION

53

Infrastructure and Climate Change

- **\$90 trillion in investment will be needed for U.S. infrastructure, 2015-2030.**
- **Add \$4 trillion (< 5%) to make it low-carbon infrastructure.**
 - This would also reduce climate damage to infrastructure.
 - Railway, urban transport, renewables.
- **The electrical grid is particularly troublesome.**
 - It is outdated and not suited for renewable energy storage.
 - Those with solar panels use the grid but contribute little to its upkeep.

NATIONAL ECONOMIC
EDUCATION DELEGATION

54

Climate Change Policy

NATIONAL ECONOMIC
EDUCATION DELEGATION

55

Policies That Reduce Emissions: Directly

- **Regulation**

- Emissions standards or limits
 - E.g., CAFE standards

- **Market-oriented policies**

- Putting a price on emissions
 - Subsidizing green energy (*e.g.*, feed-in tariffs)
 - Tax or cap & trade

NATIONAL ECONOMIC
EDUCATION DELEGATION

56

56

How Does Cap and Trade Work?

- **Activities to be covered are determined.**
- **Acceptable emissions levels are indicated.**
- **“Permits” that allow acceptable emissions levels are issued.**
 - How?
 - According to historical emissions?
 - Evenly across emitters?
 - Sold at some price?
- **A “market” is developed.**
- **Those desiring to emit will have to buy sufficient permits to accommodate their emissions.**
- **Those wishing to abate will offer their permits on the “market”.**
 - The price of a permit indicates:
 - The benefit of eliminating further emissions.
 - The cost of emitting.
- **Gov’t agency determines equality of permits in possession and emissions.**

57

How Does a Carbon Tax Work?

- **Activities to be covered are determined.**
- **The price of emissions is determined.**
 - Presumably some relation to the social cost of polluting.
- **Emissions are measured.**
- **Taxes are determined.**
- **Q: What to do with the tax revenue?**

58

Putting a Price on Carbon

Suppose a Social Cost Of Carbon of \$50

59

Putting a Price on Carbon

TAX
= Permit Price
= Carbon Price

60

Carbon Prices: the Good and Bad

- **Good:**
 - Provide price signal to lower emissions.
 - They yield low-cost reductions in emissions.
 - They spur innovation in clean technologies.
- **Bad:**
 - Firms might leave to flee regulation.
 - It is necessary to monitor emissions.
 - Potentially regressive
 - Costs may weigh more heavily on low-income households.

Revenue Dividend Eliminates Regressivity

IMPACT OF CARBON DIVIDENDS ON U.S. FAMILY INCOMES

Carbon Tax and Cap & Trade: the Differences

	Carbon Tax	Cap & Trade

NATIONAL ECONOMIC EDUCATION DELEGATION

63

Carbon Tax and Cap & Trade: the Differences

	Carbon Tax	Cap & Trade
Carbon Price	Certain	Uncertain
Emissions	Uncertain	Certain
Ease of Implementation	May be easier to implement	
Additional concerns	1) Always generates revenue 2) May require legislation to change 3) Predictability	1) Susceptible to lobbying. 2) Only generates revenue if government sells permits. 3) Cap can be changed by regulator. 4) Less certainty over future. 5) Regulations reduce efficacy of Cap & Trade

NATIONAL ECONOMIC EDUCATION DELEGATION

64

One Other Thing: Cap and Trade vs. Carbon Tax

- **Emissions regulations and Cap and Trade can work at cross purposes.**
 - Regulations that lower emissions from big polluters...
 - Lower the demand for permits
 - Lowers the price of permits
 - Reduces incentives for other industries to cut emissions
- **Regulations can undermine the effectiveness of Cap and Trade.**
- **The same is not true of a carbon tax.**
 - Though regulations might cut tax revenue, revenue is not the goal of the carbon tax.

Thoughts on Regulation vs Market-Oriented

- **Equity.**
 - Both types of policies are regressive.
 - Cap and Trade and a Carbon Tax can offset the regressivity.
 - Regulations do not.
- **Efficiency.**
 - Market-oriented policies tend to achieve emissions reduction at much lower cost.
 - Example: CAFÉ Standards vs Carbon Tax
 - Tax is significantly more efficient.
 - Why?

Efficiency: CAFÉ vs Carbon Tax

- **CAFÉ = Corporate Average Fuel Efficiency**
 - A fuel economy standard mandating that an auto-maker's vehicle fleet must meet minimum fuel economy standards.
- **Horse Race**
 - Tax on fuel applies to ALL vehicles, not just new.
 - Rebound Effect:
 - o Driving a more efficient vehicle lowers the cost per mile driven
 - leading to more miles driven.
 - Slower turnover of inefficient vehicles: higher cost of new.
- **Summary**
 - A given level of emission reductions **costs 3-14 times more with CAFÉ** standards than under a comparable carbon tax.

67

Policies That Reduce Emissions: INDIRECTLY

- **Subsidizing R&D**
- **Grid / infrastructure**
- **Energy efficiency mandates and subsidies**
- **Mandating renewable energy (e.g., renewable portfolio standards)**
- **Land use policies**

U.S. Carbon Tax Plans

- Climate Leadership Council
- Citizens Climate Lobby
- States and municipalities:
Washington state, Oregon,
Washington, DC

“ Economic policies will be central to accomplishing the goals we choose.”

- Harris and Roach (2007)

Summary

- Climate change is real, is caused by human actions, and has impacts we're already feeling.
- We need to reduce emissions to balance the costs of action against the costs of inaction.
- Scientists and the IPCC recommend that we work to keep warming below 1.5 degrees celcius.

- *Economists believe that this goal is well worth the costs!*

NATIONAL ECONOMIC
EDUCATION DELEGATION

95

Summary – *continued*

- There are many ways to reduce emissions.
- Economics-inspired policies can help us do this at the lowest cost.
- Taxes and cap and trade are proven effective tools to fight climate change!
- Other tools may also be necessary.

NATIONAL ECONOMIC
EDUCATION DELEGATION
