

## Climate Change Economics Jon Haveman, Ph.D.

Socratic Circus, OLLI

## National Economic Education Delegation

- One day, the public discussion of policy issues will be grounded in an accurate perception of the underlying economic principles and data.

#### Mission

- NEED unites the skills and knowledge of a vast network of professional economists to promote understanding of the economics of policy issues in the United States.

#### NEED Presentations

- Are **nonpartisan** and intended to reflect the consensus of the economics profession.

### Who Are We?

#### Honorary Board: 44 members

- 2 Fed Chairs: Janet Yellen, Ben Bernanke
- 6 Chairs Council of Economic Advisers
  - o Furman (D), Rosen (R), Bernanke (R), Yellen (D), Tyson (D), Goolsbee (D)
- 3 Nobel Prize Winners
  - o Akerlof, Smith, Maskin

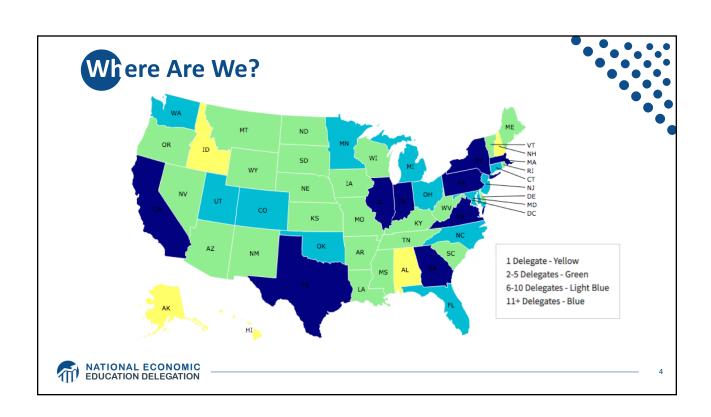

#### • Delegates: 361 members

- At all levels of academia and some in government service
- All have a Ph.D. in economics
- Crowdsource slide decks
- Give presentations

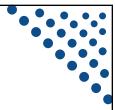

#### • Global Partners: 42 Ph.D. Economists

- Aid in slide deck development

## **Cre**dits and Disclaimer

- This slide deck was authored by:
  - Shana Mcdermott, Trinity University
  - Sarah Jacobson, Williams College
  - Sharon Shewmake, Western Washington University
- This slide deck was reviewed by:
  - Jason Shogren, University of Wyoming
  - Walter Thurman, North Carolina State University
- Disclaimer
  - NEED presentations are designed to be nonpartisan.
  - It is, however, inevitable that the presenter will be asked for and will provide their own views.
  - Such views are those of the presenter and not necessarily those of the National Economic Education Delegation (NEED).

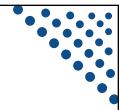

- Climate change science
- Impacts of climate change
- Economics of responding to climate change
- Addressing the sources of our emissions
- Climate change policy
- Policy in action

# How Can Economists Contribute to Thinking about Climate Change?

- By assessing behavioral reactions to climate change.
- By measuring the damage and estimating the economic costs of fighting climate change.
- By designing smart policies that minimize costs.
  - Balance economic growth with GHG emission mitigation.

7

## Polution Imposes Costs Outside the Market

- Pollution is an EXTERNALITY: a side effect (cost or benefit) that affects someone else when something is bought or sold.
  - The power company sells you electricity for your house, but the pollution from the power plant affects everyone, not just you!
  - This is a market failure.
- All of the effects are not always felt by the buyers and sellers.
  - The price of electricity does not reflect all of the costs—there is too much pollution.
  - Electricity is too cheap. Too much will be produced.
- There is a cost of electricity above the price paid.

## **Social Cost of Carbon**

- Cost above price paid.
- The expected cost of damages from each unit of greenhouse gas emissions.
- Current EPA estimate: ~\$40 per metric ton of CO<sub>2</sub>.
  - About \$123/car per year.
  - \$26 Billion for all vehicles in the US.
- Social cost of carbon will increase over time.

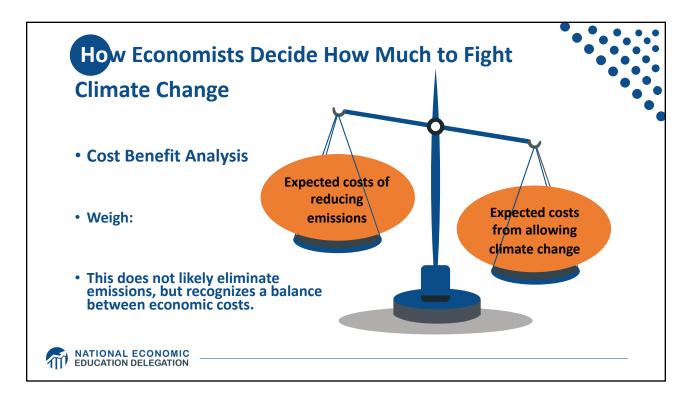

# **Economics of Responding to Climate Change**

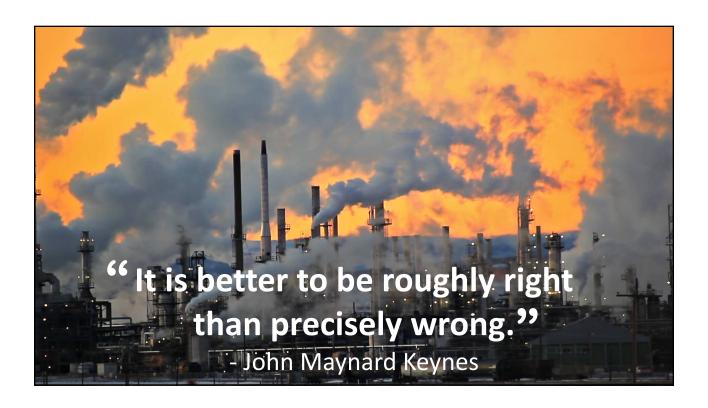

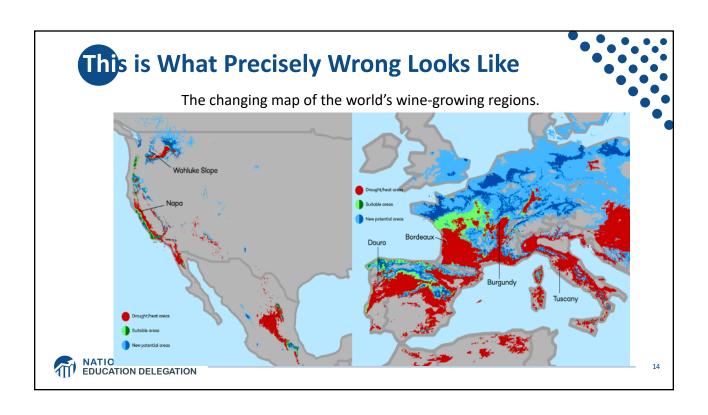

# Cost-Benefit Analysis of Fighting Climate Change

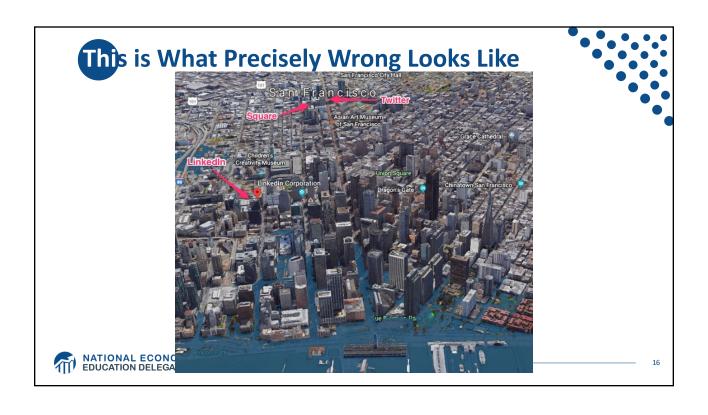

- Costs of acting to keep warming below 2°C are almost certainly less than future economic damages they would avoid.
  - Stern Report estimate: damages could be as high as 20% of worldwide GDP.
- Caveats:
  - Putting a monetary value on priceless things
  - Inequality
  - Uncertainty and risk

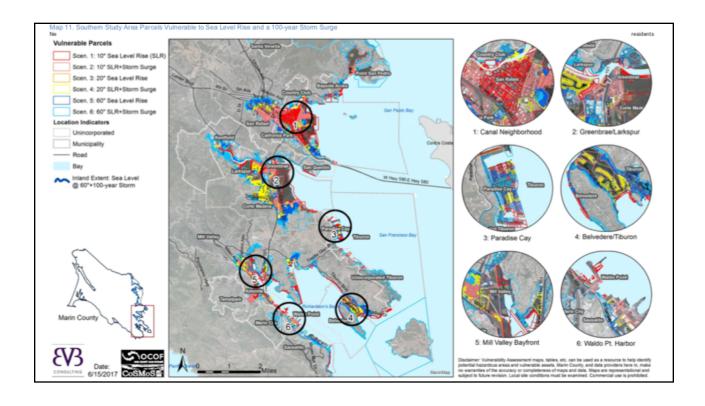

## **Economic Growth and Climate Change Action Are Compatible**

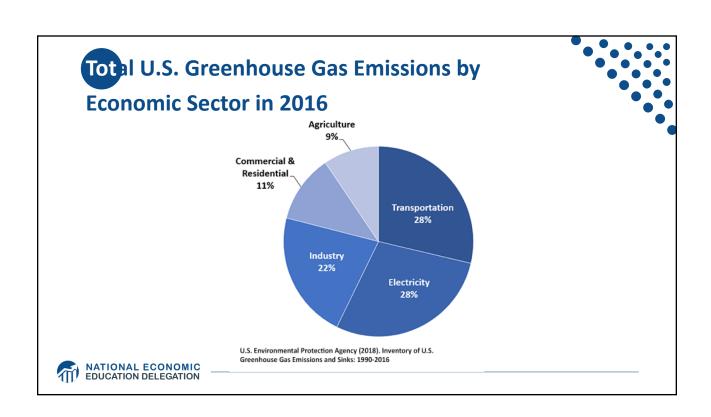

- Abating greenhouse gas emissions is costly...
  - ... but climate change damages are even more costly.
- Economic growth comes with consequences that we have to deal with, including climate consequences.
- Economies with environmental regulations can still be dynamic.
- Goal: design policies that reach climate goals at the least possible cost.

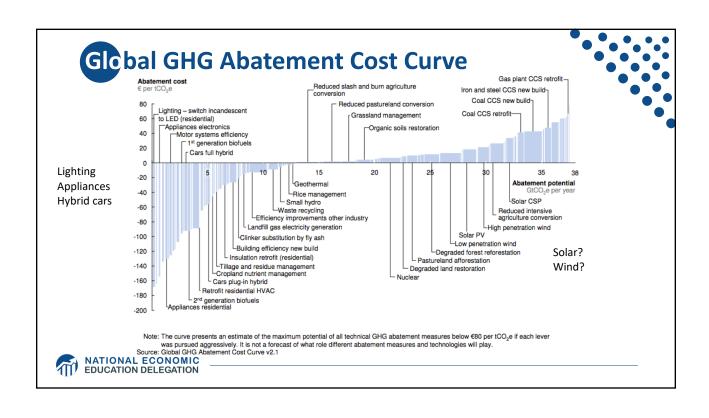

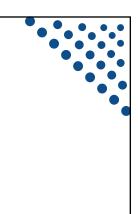

# Addressing the Sources of Our **Emissions**

## **Climate Change Policy**

## Policies That Reduce Emissions: Directly

- Regulation
  - Emissions standards or limits
    - o E.g., CAFE standards
- Market oriented policies
  - Putting a price on emissions
    - o Subsidizing green energy (e.g., feed-in tariffs)
    - Tax or cap & trade

23

## **How Does Cap and Trade Work?**

- Activities to be covered are determined.
- Acceptable emissions levels are indicated.
- "Permits" that allow acceptable emissions levels are distributed.
  - How?
    - o According to historical emissions?
    - o Evenly across emitters?
    - Sold at some price?
- A "market" is developed.
- Those desiring to emit will have to buy sufficient permits to accommodate their emissions.
- Those wishing to abate will offer their permits on the "market".
  - The price of a permit indicates:
    - o The cost of emitting.
    - o The cost of eliminating further emissions.
- Agency determines equality of permits in possession and emissions.

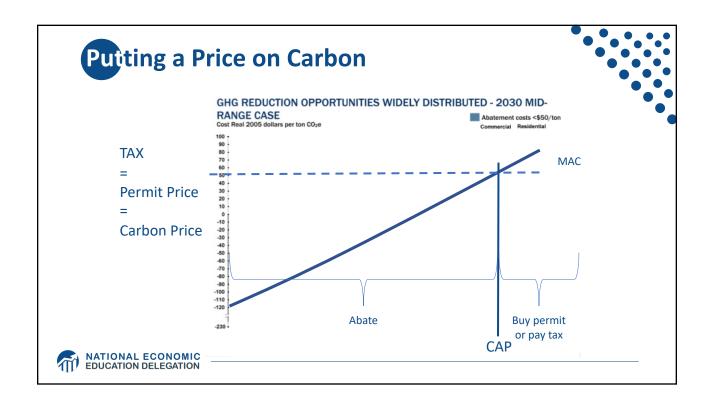

- Activities to be covered are determined.
- The price of emissions (tax) is determined.
  - Presumably some relation to the social cost of polluting.
- Emissions are measured.
- Taxes are determined and paid.
- Q: What happens to the revenue?

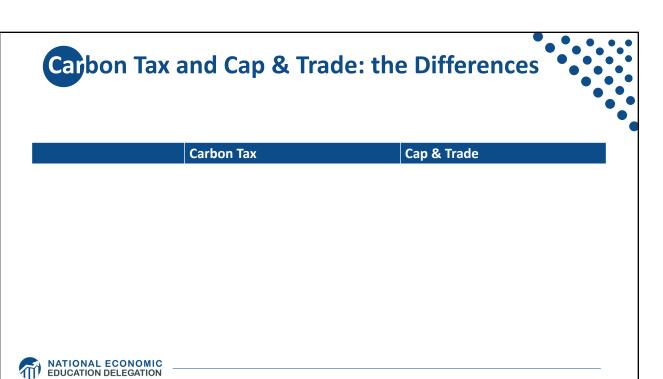

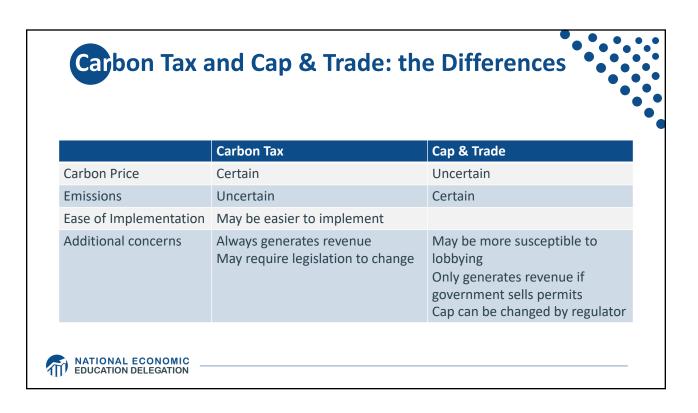

25

# Suppose a Social Cost Of Carbon of \$50 Suppose a Social Cost Of Carbon of S

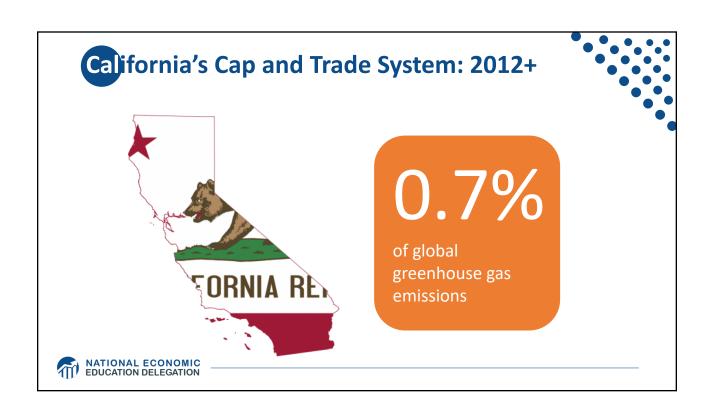

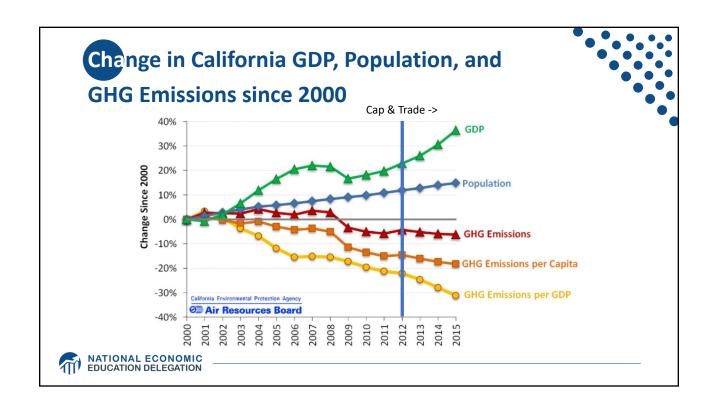

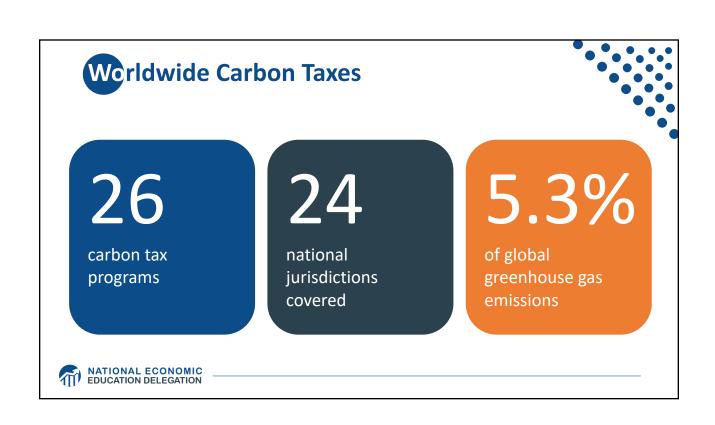

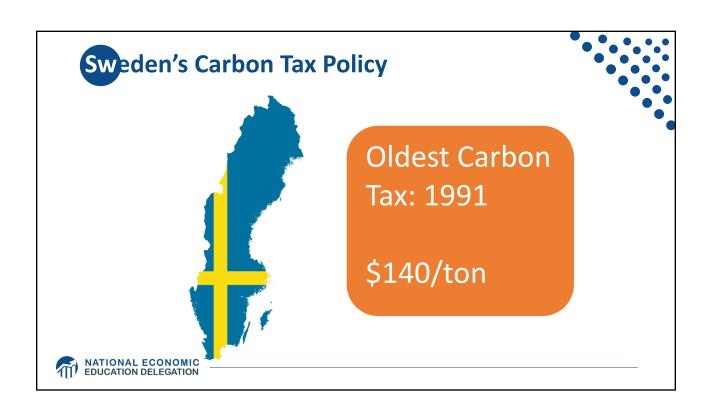

## **Climate Change Policy in Action**

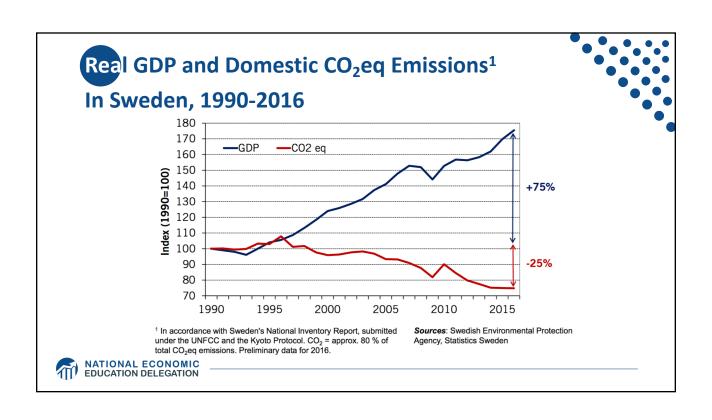

- Climate Leadership Council
- Citizens Climate Lobby
- States and municipalities: Washington state, Oregon, Washington, DC

- There are many ways to reduce emissions.
- Economics-inspired policies can help us do this at the lowest cost.
- Taxes and cap and trade are proven effective tools to fight climate change!
- Other tools may also be necessary.
